Computer Configuration and Shopping System

ABSTRACT:

The "Computer Configura on and Shopping System" is a Java-based program designed to assist customers in selec ng and purchasing customized computers from a variety of popular computer manufacturers. This interac ve applica on allows users to choose their preferred computer company, processor type, RAM size, storage type, and storage capacity. Based on these selec ons, the program calculates the total cost of the computer and provides the op on to add the configured computer to a virtual shopping cart.It is a comprehensive software solution designed to streamline the process of configuring and purchasing computer systems. In the rapidly evolving world of technology, users often face challenges in selecting the most suitable hardware components for their computing needs. This system aims to simplify the entire journey, providing a user-friendly interface that guides customers through the configuration process and facilitates seamless online purchases.
